THE PORTRAIT OF THE BODY

AI / PERSONAL EXPRESSION / SPORTS

AI-assisted sports films, shaped by personal intent.

Tennis footage holds more than technique. Some players value progress; others want to share a mood or a personal style. We bring these different intentions into the making of a film.

MY ROLE

Choice system / technical development / exhibition interaction / 16 profile cards

COLLEGE + INDUSTRY

Chengshi Sports (Alibaba)
Three-person team project

SELECTED FILM OUTPUTS / TWO VISUAL DIRECTIONS

01 / COMIC ENERGY

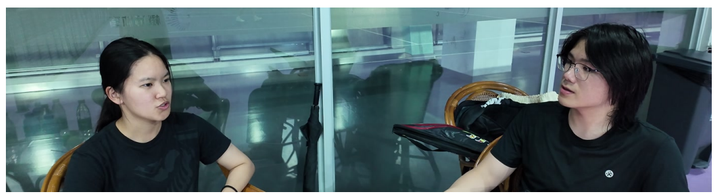

02 / COLOR + ATMOSPHERE

Different players. Different ways of being seen.

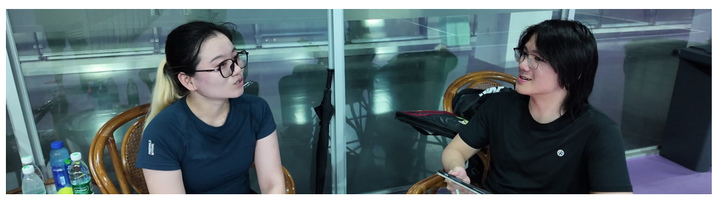

Four interviews explored recording, reviewing, editing and sharing - and what each person wanted a sports film to say about them.

I01 / 03:21.280-03:43.380 ORIGINAL AUDIO

I03 / 05:33.530-05:46.530 ORIGINAL AUDIO

I04 / 02:21.380-02:44.220 ORIGINAL AUDIO

01 A record for myself

The participant mainly kept footage for personal recording and review, and rarely shared it.

DESIGN IMPLICATION

Keep a private archive and make sharing optional.

INPUT / AUDIENCE + SHARING

02 A feeling I want to show

The participant wanted to communicate an attitude and the uplifting quality of playing sport.

DESIGN IMPLICATION

Let the visual tone express a quality the athlete wants to show.

INPUT / TONE + ATMOSPHERE

03 A choice I want to make

The participant valued judging which moments to keep and taking part in editing.

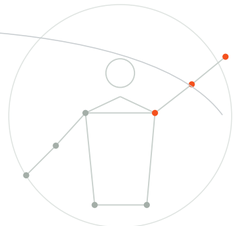

DESIGN IMPLICATION

Ask users to confirm highlights and adjust the direction of the film.

INPUT / CREATIVE CONTROL

MY DESIGN DECISION

Body data + personal intent.

The team first aimed for full automation. I proposed that the athlete's own ideas should join body data as creative input.

I designed a choice system to make recording purpose, expressive intent and visual preferences explicit. It later informed the AI director-crew concept, where users can keep, change or delegate decisions.

RESEARCH POSITION

These four conversations offered situated design material, rather than a universal model of personality.

VALUE REFERENCE / DATA HUMANISM

Place data within lived experience, context and subjective interpretation. Giorgia Lupi.

METHOD REFERENCE / SPORTSBUDDY

Connect sports footage, visual cues and interactive storytelling. Lin et al., 2025. Summaries above are paraphrases.

From personal choices to a generated film.

I organised interview differences into four choice points, four expression families and sixteen starting profiles - then made room to revise the direction.

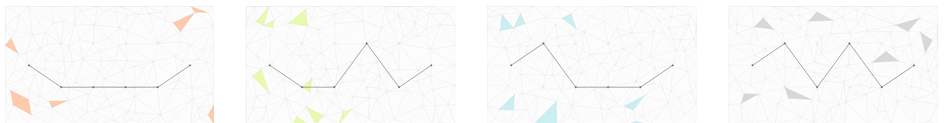

4 CHOICES
16 PROFILES

01 Make personal intent an input

01 / MOTIVATION	02 / FOCUS	03 / DATA	04 / CONNECTION
○ For myself	○ Technique	○ Record / archive	○ Reserved
○ For social media	○ Atmosphere	○ Aesthetic expression	○ Proactive

Choices make audience, focus and expressive intent explicit. Each profile is a starting point that the person can still adjust.

02 Four families / sixteen variations

EMOTION SPLASH | TACTICAL MATRIX | KINETIC ECHO | SILENT ARCHIVE

Each family contains four finer variations. The original cards carry a path, a character poem and visual recommendations.

03 Co-create with the director crew

● **POSE**	Track the body	● **SCOUT**	Read the action	● **SELECT**	Find moments
● **SCRIPT**	Frame the story	● **VFX**	Shape the image	● **EDIT**	Assemble the film

SCOUT / KEEP WHAT FEELS LIKE YOU

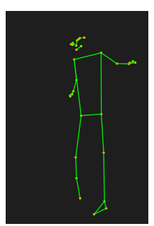

- [x] Forehand rally
- [x] Backhand exchange
- [ ] Serve

LET THE CREW CHOOSE | KEEP MY PICKS →

Users can accept suggestions, keep their own highlights, change tone or delegate the next step. The English interface is redrawn from the interaction prototype.

04 Use body analysis to shape the image

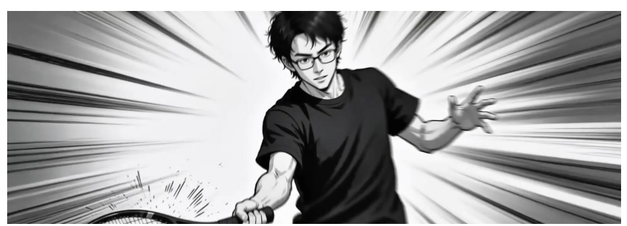

VIDEO Source footage → **BODY + MOTION** Pose / segmentation → **EVENTS** Meaningful timing → **EFFECTS** Intensity / style → **COMPOSITION** Final film

BODY LANDMARKS

EFFECT ON THE ACTUAL ATHLETE

EXPRESSIVE FILM DEMO / PLAY

I implemented body-keypoint tracking, person segmentation and event-based effect control. A key iteration kept the skeleton as an analytical layer and applied effects to real body footage, preserving the athlete's appearance and movement.

Make personal choices tangible.

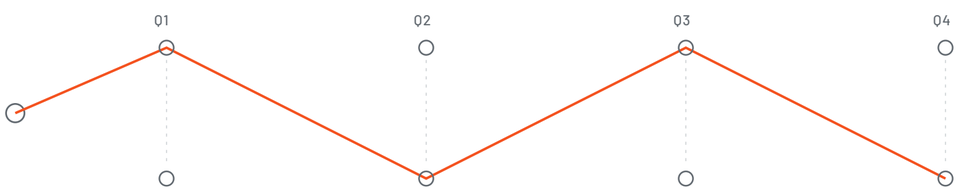

Wind a path, find a profile card and layer visual effects over a fixed tennis image. The interaction makes abstract preferences visible before a film is produced.

01 Wind a personal path

One starting hole leads to eight copper posts in two rows and four columns. Visitors choose one post in each column, turning four decisions into a visible path.

ONE START / FOUR COLUMNS / TWO OPTIONS EACH

02 Find the matching card

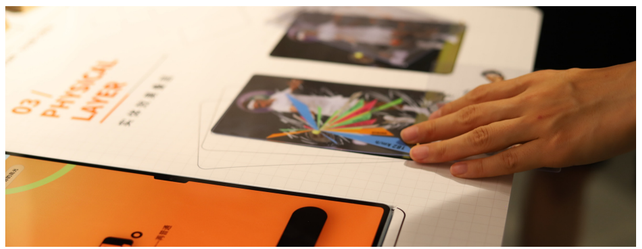

I designed 16 double-sided cards. Each front matches a path; its reverse combines a character poem with recommended visual effects.

ALL SIXTEEN ORIGINAL FRONT DESIGNS

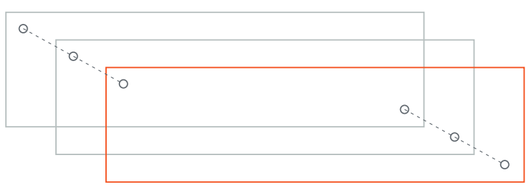

03 Layer the visual effects

Visitors choose transparent effect cards and place their holes over two posts on a Federer image. The shared base lets them compare different visual combinations directly.

TWO-POST ALIGNMENT / SCHEMATIC

CARD 01 / TRANSLATED EXCERPT

She does not shine through someone else's template; she makes the whole movement her own.

Bring the portrait into a shared space.

I connected the research display, moving-image screen, winding apparatus and profile cards as one exhibition experience.

COURSE EXHIBITION / Final presentation group photograph.

MY EXHIBITION WORK

An exhibition built around participation.

I organised the installation as a sequence: understand the theme, make a choice, try a visual combination and watch the films. White surfaces, orange headings and black type connected the digital and physical parts.

Hanging body models, lines and cards echoed the table's thread paths. Together, material details and hands-on actions brought the body, movement and personal expression into one setting.

MY CONTRIBUTION

Choice system + technical implementation + exhibition interaction.

LIVE EXPLANATION / Guiding visitors through the project.

THE TABLE / Choices, cards and layers.

Best Award

The project received the collaboration's sole Best Award and recognition from Chengshi Sports.

My interest: connect personal expression, AI-assisted creation and physical interaction so that technology responds to a particular person.
